#### Descripción

A new plugin has been developed, to enable the running of external processes from MeCoSim. Presents the following entry points:

- open -> Open the desired file with the default program assigned in the OS.
- mail -> Open our default mail manager ready to send an email for the given target.
- browse -> Open the given URL in our default browser.
- run -> Run the given executable program.
- runCmd -> Run the given command as if we were in our shell/command line. Up to now, it does not manage the input, output and error streams, that are ignored. A review of this functionality is planned.
